$$E(X) = \mu$$
,  $E(X^{2}) = 6^{2} + \mu^{2}$   
 $E(X) = \mu$ ,  $E(X^{2}) = \frac{6}{12} + \mu^{2}$   
 $E(X_{1} - \overline{X}) = E(X_{1}) - E(\overline{X}) = 0$ 

HW<sub>3</sub>

1. If  $X_1, X_2, ..., X_n$  are i.i.d. random variables with mean  $\mu$  and variance  $\sigma^2$ , calculate the covariance  $\overline{X}$  and  $X_i - \overline{X}$  for any i = 1, ..., n.  $\begin{pmatrix} (\sqrt{X}, \overline{X}; -\overline{X}) = E[\overline{X} - E(\overline{X})](\overline{X}; -\overline{X}) - E(\overline{X}; -\overline{X}) - E(\overline{X}; -\overline{X})] = E[\overline{X}, \overline{X}; -\overline{X}] - \mu \overline{X}; + \mu \overline{X}]$   $= E[\overline{X}, \overline{X}] - E[\overline{X}] - \mu E[\overline{X}] + \mu E[\overline{X}] = E[\frac{1}{N} - \frac{1}{N} + \mu^2] = \frac{1}{N} \cdot \frac{1}{N} - \frac{1}{N} \cdot \frac{1}{N} = \frac{1}{N} \cdot \frac{1}{N} \cdot \frac{1}{N} \cdot \frac{1}{N} = \frac{1}{N} \cdot \frac{1}{N} \cdot \frac{1}{N} \cdot \frac{1}{N} \cdot \frac{1}{N} = \frac{1}{N} \cdot \frac$ 

- 2. A commercial for a manufacturer of household appliance claims that 3% of all its product require a service call in the first year. A consumer protection association wants to check the claim by surveying 400 households that recently purchased one of the company's appliances. What is the probability that more than 5% require a service call within the first year?
  - (a) Calculate the probability using the approximate normal approach.

$$N = 400$$
  $X \sim B(400, 3\%)$   $P(X > 20) = 0.00951\%$ 
 $P = 3\%$   $P(X > 20) = 0.00951\%$ 

When  $P = 5\%$ , about 20 households require a scrice.

(b) Calculate the probability using the binomial distribution.

$$X \sim B(400, 3:1.)$$
  $\rho(X > 20) = 0.01045$ 

- 3. Suppose that X has normal distribution with mean  $\mu=10$  and standard deviation  $\sigma=2$ . Doing the following parts:  $\chi \sim (10, 2^2)$ 
  - (a) Calculate P(6 < X < 14).

$$p(-2 < z < 2) = 0.9545$$

(b) Find the percentile c such that  $P(X \le c) = 0.95$ .

$$\frac{C-10}{2} = 1.64489 \qquad C = 13.2899$$

$$n=9$$
  $X_i \sim N(10,2^2)$ 

(c) A random sample of size 4, {X1, ...,X4}, is taken from the normal distribution with mean = 10 and standard deviation = 2. Find the probability that the average of this sample is at most 12.

$$\mathbb{E}[X \leq 12] = 0.99724$$

$$\mathbb{E}[X \leq 12] = 0.99724$$

$$\mathbb{E}[X \sim N(10, \frac{2}{4}) \rightarrow f(X \sim N)]$$

- 4. Bits are sent over a communications channel in packets of 160. If the probability of a bit being corrupted (one error) over this channel is 0.2 and such errors are independent. Let X denotes the number of bits that are corrupted over this channels.
- (a) What is the distribution of X? Can it be approximated as normal distribution?

$$E(X) = np = 32$$
 $Vow(X) = npq = 25.6$ 

Yes.  $X \sim Bimm(160,0.2)$ 
 $\sim N(32,25.6)$ 

oppose.

(b) Approximately, what is the probability that more than 50 bits in a packet are corrupted?

$$P(X \ge 50) = P(Z \ge 3.5515) = 0.000/87/$$

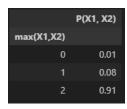

= sampling with replacement

5. A large population is described by the probability distribution

Х	f(x)
0	0.1
1	0.2
2	0.7

## Let X1 and X2 be a random sample of size 2 from the distribution

(a) Determine the sampling distribution of  $max(X_1,X_2)$ ?

(b) Determine the sampling distribution of  $X_1+X_2$ ?

	P(X1, X2)
X1+X2	
0	0.01
1	0.04
2	0.18
3	0.28
4	0.49

$$E(X_{i}) = \mu, \ \forall \alpha_{1}(X_{i}) = \delta^{2}$$

$$E(X_{i}) = \mu, \ \forall \alpha_{1}(X_{i}) = \frac{6^{2}}{n}$$
